Temporal Memory - Long Cycles

Peter Overmann, 02 Aug 2022

A temporal memory based on three Triadic Memory instances can learn and reproduce cycles of very long sequences.

The test data in this example is a sequence of 5000 random integers in the range from 1 to 100, repeated 4 times.

At each step, the algorithm predicts the next step. Correct predictions are shown in black, mispredictions in red.

After just one iteration, the sequence is recognized and most items in the test sequence are correctly predicted.

After three iterations, all predictions are correct.

Temporal/Sequence Memory Algorithm

Configuration

```
Get[ $UserBaseDirectory <> "/TriadicMemory/triadicmemoryC.m"]
n = 1100; p = 4;
TemporalMemory[T, {n, p}];
```

Encoder / Decoder

Test data

```
k = 5000;
testdata = RandomInteger[{1, 100}, k];
testdata = Flatten[Join[Table[testdata, 4]]];
```

Test function

Test

```
temporalmemory[ testdata]
```

```
11 8 30 51 73 56 72 100 25 97 96 46 87 25 80 60 73 82 89 5 18 5 78 28 94 67 38 30 3 14 87 16 45 33 5 36 31 58 44 46 68 12 80 81 39 65 70 62 46 68 59 95 21 71 21 58 58 12 74 33 67 8 37 88 6 38 55 37 43 36 19 47 40 48 61 92 10 40 95 73 82 2 97 40 43 46 21 57 99 35 87 64 49 40 59 65 36 12 82 87 77 64 11 84 47 1
